

6.4 Communicating a Feasibility Assessment [↕]

Guiding Questions

1. What should a feasibility report include?
2. How do you explain technical results to non-technical readers?
3. What assumptions should be stated clearly?
4. How do you make the final recommendation easy to follow?
5. How should risks be reported?

EXPLORE

What you will learn

- How to structure a feasibility report.
- How to present results clearly to different audiences.
- How to link technical analysis to a decision.
- How to summarize financial results without losing meaning.
- How to write a persuasive recommendation based on evidence.

A feasibility report should do more than present calculations. It should explain what the numbers mean and support a decision.

Recommended structure

- Executive summary: State the project, the main findings, and the recommendation.
 - Project background: Explain the proposal, the purpose, and the business context.
 - Assumptions and projections: Show sales, costs, timing, and key operating assumptions.
 - Financial appraisal: Present break-even analysis, NPV, IRR, and cash flow results.
 - Risk analysis: Show sensitivity and scenario results.
 - Conclusion and recommendation: State whether the project should proceed.
-

Writing principles

- Use plain language first.
 - Define technical terms.
 - Explain assumptions clearly.
 - Show key numbers in tables.
 - State the decision implication of each result.
 - Avoid clutter and repetition.
-

Example recommendation

“The project is financially feasible under the base case because it produces a positive NPV and an IRR above the required return. However, it is sensitive to sales volume, so demand risk must be managed carefully. On balance, the project should proceed if marketing assumptions are achievable and costs remain within forecast.”
